**Product Overview**

The FSP-3x1B is a family of passive infrared (PIR) outdoor sensors that raise or lower the electric lighting level to high, low or off based on motion and/or daylight contribution. Typically, once the sensor stops detecting movement and the time delay elapses, lights will first fade to low mode, and eventually switch off. When motion is detected, the sensor ramps the light level to high mode unless the daylight contribution is sufficient.

The integral photocell can also switch the lights on and off for dusk to dawn control, so that lighting remains on overnight even without motion detection.

The sensors control 0-10VDC or nondimming LED drivers or ballasts.

The low voltage FSP-301B may be used with dim-to-off drivers or ballasts.

Initial setup and subsequent sensor adjustments are made using the Sensor Configuration App, available on Google® or the Apple® App Store. This tool enables adjustment of sensor parameters including high/low mode, sensitivity, time delay, cut off and more.

The Sensor Configuration App can read current parameter settings, and stores up to six sensor parameter profiles to speed commissioning of multiple sensors.

The FSP-3x1B family is available in three configurations for mounting inside a fixture, to the outside of a fixture or enclosure via a 1/2” knockout, or to a pole.

---

**Specifications and Features**

- **Load Ratings (FSP-311B, FSP-321B):**
  - @ 120V 0–800W tungsten, ballast, LED driver; 1/6hp motor
  - @ 230–240V 0–300W ballast, LED driver
  - @ 277V 0–1200W ballast, LED driver; 1/6hp motor
  - @ 347/480V 0–1200W ballast, LED driver (FSP-321B only)

- **Current consumption (FSP-301B):** 15 mA max.
  - 0–10V sinking current: 50mA

- **Three interchangeable lenses for mounting between 8’ and 40’**

- **Remote setup and adjustment via the iOS® or Android® Sensor Configuration App**

- **Adjustable high and low modes (high: 0 to 10V, low: off, 0 to 9.8V)**

- **Adjustable time delay (30 seconds, 1 to 30 minutes)**

- **Adjustable cut off delay (none, 1 to 59 minutes, 1 to 5 hours)**

- **Adjustable sensitivity/service mode (low, med, max; on-fix, off-fix)**

- **Adjustable setpoints: hold off setpoint (none, 1 to 250 fc, auto); photocell on/off setpoint (1 to 250 fc)**

- **Adjustable ramp and fade times (1 to 60 seconds)**

- **Lead length: 36” (91.44cm), 30” (76.2cm) from nipple**

- **Operating temperature: -40°F to +167°F (-40°C to +75°C)**

- **Weight: FSP-301B, 4.9oz (140g); FSP-311B & FSP-321B, 6.7oz (190g)**

- **UL and cUL listed (E101196)**

- **Five year warranty**

**Materials**

- Polycarbonate, flame retardant, UV resistant, impact resistant, recyclable

- Meets materials restrictions of RoHS

**Factory Defaults**

- **High mode:** 10V
- **Low mode:** 1V
- **Time delay:** 5 minutes
- **Cut off:** 1 hour
- **Setpoint:** Disabled
- **Sensitivity:** Max
- **Ramp up time:** Disabled
- **Fade down time:** Disabled
- **Photocell On/Off:** Disabled

---

**Models**

- FSP-301B, 12–32VDC
  - Use with dim-to-off driver or ballast or with Wattstopper power pack

- FSP-311B, 120–277VAC (single phase), 50/60Hz

- FSP-321B, 100–347VAC (single phase) or 208/230/480VAC (phase-to-phase)

1. Determine an appropriate mounting location inside the light fixture. Allow a minimum distance of 0.2” (5.1mm) from the end of the sensor to the wall of the fixture.

2. Drill a 1.30” (33mm) diameter hole through the sheet metal in the bottom of the fixture.

3. Place the rubber gasket on the threaded collar, and install the sensor face down, parallel to the mounting surface. Ensure the rubber gasket touches the inside surface of the fixture. Install the tightening nut securely against the fixture to a torque of 25-30 in-lbs to ensure IP rating is maintained.

**NOTE:** An optional collar can be installed in place of the tightening nut on the FSP-3x1B. This collar is included with the FSP-3x1B-S and FSP3x1B-D, as shown below.

4. Align the locking features between the sensor and lens module and push the lens module forward until the O-ring seals firmly. Turn the lens module clockwise to lock in place.

5. Connect load, supply and control wires.

6. Restore power from the circuit breaker.

**Installing the FSP-3x1B in the light fixture**

**NOTE:** The outside fixture wall thickness should be no greater than 0.125” (3.18mm) for optimal sensor mounting and security.

**Dimensions of Lens Options**

</tr>
</tbody>
</table>

**FSP-L2-S, FSP-L3-S, and FSP-L7-S Dimensions**

The FSP-Lx-S models include a shroud, which blocks high-angle light coming from the fixture, to improve photocell performance. With the shroud attached, the dimensions for all three lenses are identical.

Installing the FSP-3x1B-S or FSP-3x1B-D To a Fixture or Pole

1. Determine an appropriate mounting location minimizing the electrical light contribution to the sensor’s photocell.
2. Drill a 0.875” (22mm) diameter hole through the mounting surface, or mount to a 1/2” knockout.
3. Place the rubber gasket on the threaded collar, and install the sensor face down, parallel to the mounting surface. Ensure the rubber gasket touches the mounting surface. If needed, add the spacer between the sensor body and the rubber gasket to ensure a secure fit. Install the nipple nut and torque to 25-30 in-lbs to maintain IP rating.
4. Align the locking features between the sensor and lens module and push the lens module forward until the O-ring seals firmly. Turn the lens module clockwise to lock in place.
5. Connect load, supply and control wires.
6. Restore power from the circuit breaker.

Installing the FSP-3x1B-D to a pole using the optional spacer

NOTE: The outside fixture wall thickness should be no greater than 0.125” [3.18mm] for optimal sensor mounting and security.

Installing the FSP-3x1B-S to the exterior of a fixture

NOTE: The outside fixture wall thickness should be no greater than 0.125” [3.18mm] for optimal sensor mounting and security.

Adjustable Control Parameters

The Sensor Configuration App is a convenient tool for setting up FSP-3x1B sensors. Adjustable settings can be changed as needed for specific applications.

1. High Mode: When the sensor detects motion the dimming control output ramps up to the selected HIGH light level (default is 10V).
2. Low Mode: After the sensor stops detecting motion and the time delay expires the dimming control output fades down to the selected LOW light level (default is 1V).
3. Time Delay: The selected time period that must elapse after the last time the sensor detects motion for the electric lights to fade to LOW mode (default is 5 minutes).
4. Cut Off: The time period that must elapse after the lights fade to LOW mode and the sensor detects no motion for the electric lights to turn OFF (default is 1 hour).
5. Sensitivity: The response of the PIR detector to motion within the sensor’s coverage area (default is max).
6. Setpoint: When enabled, the selectable ambient light level threshold that will hold the electric lights off or at LOW level when the sensor detects motion (default is disabled).

The Auto option invokes an automatic calibration procedure to establish an appropriate setpoint based upon the contribution of the electric light. As part of this procedure, the controlled load is turned on for two minutes to warm up the lamp, and then switched off and on eight times, terminating in an off state. After this process, a new setpoint value is automatically calculated.
7. **Hold Off:** The selectable ambient light level threshold that will hold the lights off or at LOW level when the sensor detects motion (default is Disabled). A switch allows you to Enable or Disable this feature. If enabled, select Auto Format or Custom Value. If Custom is selected, the Range is 1 fc to 250 fc.

The Auto option invokes an automatic calibration procedure to establish an appropriate setpoint based upon the contribution of the electric light. As part of this procedure, the controlled load is turned on to warm up the lamp, and then it is switched off and on eight times, terminating in an off state. After this process, a new setpoint value is automatically calculated. During this time, communication to the FSP-3X1B is disabled.

8. **Ramp Up Time:** Time period for light level to increase from LOW to HIGH (default is disabled; lights switch instantly).

9. **Fade Down Time:** Time period for light level to decrease from HIGH to LOW (default is disabled; lights switch instantly).

10. **Photocell On/Off:** When enabled, the sensor will force the load OFF after the light level has exceeded the selected photocell setpoint for at least a minute. It will also force the load ON when the light level goes below the setpoint, even if no motion is detected (default if disabled).

Once ON (initially at High), the load will dim to Low following the Time Delay, and to OFF following the Cut Off time. To ensure dusk to dawn control, Cut Off must be disabled.

The photocell On/Off setpoint is automatically set to maintain a deadband of at least 10 fc above the Hold Off Setpoint to prevent cycling if the two features are used together.

FSP-3x1-B wiring with dimming ballast or LED driver

FSP-3x1-B wiring with non-dimming load

Sequence of Operation

1. **Dimming**: When motion is detected within the sensor’s coverage area, the sensor sends a signal to ramp the load up to the selectable High Mode level unless the ambient light level is higher than the selected setpoint. When no motion is detected for the duration of the time delay setting (factory preset at 5 minutes), the lights will go to the selectable Low Mode level based on the signal from the sensor. If desired, a cut off time delay (factory preset at 1 hour) will trigger to eventually turn the lights OFF.

2. **Non dimming**: When motion is detected within the sensor’s coverage area, the sensor sends a signal to turn the load ON unless the ambient light level is higher than the selected setpoint. When no motion is detected for the duration of the time delay setting (factory preset at 5 minutes), the lights will go OFF based on the signal from the sensor.

3. **Dusk to dawn control**: When photocell on/off is enabled, and the ambient light falls below the photocell setpoint, the sensor ramps the load up to the selectable High Mode level. If no motion is detected for the duration of the time delay setting (factory preset at 5 minutes), the lights will go to the selectable Low Mode level. If the cut off time delay is disabled, the load will remain on, at High or Low level, based on motion detection, until the ambient light increases above the photocell setpoint.

Note: Unless used with a driver or ballast with a low voltage power supply, the FSP-301B requires a Wattstopper power pack (ordered separately) to operate. FSP-Lx series lens required for operation; order lens separately if ordering models listed above. Smartphone commissioning application required for configuration. Download separately.
